ALIGNMENTS

The protein sequence of hPES was deduced from the cDNA sequence obtd. by screening a human genomic library in EMBL3. hPES can be used to screen arti-inflammatory agents. An anti-body against a peptide specific to hPES can be made, and used for the determination of the protein.

A cDNA clone was obtd. (see T06027) from a HeLa cell cDNA library that encoded a novel density-enhanced Type III receptor-like PTP, designated hubEp-1 (R85203). hubEp-1 is useful for the study of PTPs and for the development of therapeutic or prophylactic cpds. e.g. for prevention of abnormal or malignant cell growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Density enhanced Type III receptor-like protein tyrosine phosphatase;
hubBP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New density enhanced protein tyrosine phosphatase - used to develop prods. to modify transcription, translation and/or activity of tyrosine phosphatase(s).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein tyrosine phosphatase, designated MOT12, suggested to play a role in the growth, differentiation and survival of neurons in the adult. The amino acid sequence was deduced from a coding sequence (see 19388) of overlapping cDNA clones isolated from human caudate nucleus and pancreas cDNA libraries. MOT12 expression is highly restricted, being found only in adult brain and pancreas in neurosecretory cell types. Polypeptides, including those that comprise residues 1-614, 615-706 or 707-1082 of MOT12 or comprise MOT12 lacking one or more of the extracellular, transmembrane or intracellular domains, can be expressed in host cells. The MOT12 polypeptides, nucleic acids encoding them, cells, tissues, transgenic animals and antibodies can be used in methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 97-503042/46.

                                                                                                                                                    Isolated ligands for flt 3 receptors - useful for treating anaemia, AIDS and various cancers Disclosure; page 25-27, 33pp, English.

CDNA encoding mouse flt3-ligand (flt3-L) was isolated from a CDNA network of T-cell line P7B-0.3A4 in CV-1/EBNA-1 cells using a slide autoradiography method. Flt3-L stimulates production of progenitor and stem cells, and can be used e.g. Sequence 231 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match 9.6%; Score 89; DB 13; Length 232; Best Local Similarity 57.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating or preventing microbial infections - using cecropin(s), attacin(s), lysozyme(s), S protein from lambda phage, E protein from pHi x174 or protein from phage 22.

Claim 108; page 58; 64pp; English.

The truncated E protein is an antimicrobial polypeptide. DNA encoding the protein is used to transform animal cells to express the protein, proteins may also be admin. to humans and animals for preventing or transforms, eg brucellosis, malarial infection. The proteins and Chagas disease.

treatment of septic shock, Theumatoid arthritis, From.

Example 2; Page 82; 96pp; English.

Chis sequence represents the preproper 3. PR-3 is active recombinant human neutrophil protease-3. PR-3 is a scrine protease, and is a tumour neutrophil protease-3. PR-3 is a scrine protease, and is a tumour neutrophil protease-3. PR-3 is a scrine protease, and is a tumour necrosis factor alpha (TNFalpha) convertase. The cDNA encoding this conscribed from the HL60 cell clone MX17. The mature PR-3 can be used in the method of the invention for identifying agents that the method of proTNFalpha to mature TNFalpha. In the method, corporated of the proTNFalpha is measured by a colourimetric assay.

Che cleavage of the proTNFalpha is measured by a colourimetric assay.

Chis is then repeated in the presence of a test compound that is thought to inhibit this process. The results of the two reactions are then compared to determine whether the test compound is an inhibitor. The cleavage inhibitors can be used in the treatment of septic shock, rheumatoid arthritis, cachexia, cerebral malaria, ischaemia/reperfusion injury, graff-host disease, autoimmune diseases, and AIDS. PR-3 can be used to treat unwanted B cell/T cell interaction by contacting it with Sequence 256 AA;

production of tylosin-related polyketide compounds claim of tylosin-related polyketide compounds claim of tylosin-related polyketide compounds claim 9; Pages 103-109; 20pp; English.

Wizzol wizzoo represent proteins encoded by the tylactone synthase gene cluster of the invention. The gene cluster is also referred to as the tyla gene, and was isolated from Streptomyces fradiae. These sequences are multifunctional proteins which direct the synthesis of the polyketide tylactone, isolated from Streptomyces fradiae. Tylactone is the basic building block of the antibiotic tylosin. The DNA sequence can be modified so as to alter the type of carboxylic acids incorporated, the number of carboxylic acids incorporated and/or the post-condensation reactions performed, thereby resulting in novel tylosin-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 55; Fig 23; 91pp; English.

3 Polypeptide sequences (W19629-30 and W00918) can be deduced from the vep ORT in polyferide synthase (PKS) gene cluster (T68715) of Streptomyces venezuelae. The sequence data indicate that the PKS gene cluster encodes a polyene of 12 carbons. The vep gene cluster contains 5 PKS modules, plus a 5' loading module and a 3' end domain. Each of the sequenced modules includes a keto-ACP, an acyltransferase, a dehydratase, a keto-reductase and an acyl carrier protein domain. A novel expression cassette encoding the first module from the vep gene cluster and module 7 from the Streptomyces trylp gene cluster has polyhydroxyalkanoate (PHA) monomer synthase activity and can be used for PHA prodn. In host (esp. insect) cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Expression cassettes for production of polyhydroxyalkanoate(s) provide wide range of biodegradable polymers for medical or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       W19629;
01-SEP-1997 (first entry)
Streptomyces venezuelae polyketide synthase.
Polyketide synthase; polyhydroxyalkanoate monomer synthase;
polyhydroxybutyrete; blodegradable polymer; vep gene;
metabolic engineering.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 63; DB 25; Length 1841; Pred.         Edysteroid dependent regulation of genes in mammalian cells -
for induced expression of heterologous genes
for induced expression of heterologous genes
bisclosure; F19 1, 45pp; English.
This sequence represents an ecdysteroid receptor DHR23alpha. DHR23-
alpha is a Drosophila steroid receptor homologue which can function as
a ligand-dependant transcription factor in mammalian cells when induced
by specific ecdysteroids such as DHR23alpha. The activity of DHR33-
alpha is induced upon administration of certain ecdysteroids but not
any of the mammalian hormones tested. DHR23alpha has been reported to
                                                                                                                                                                                                            regulate transcription of genes containing ecdysone response elements
in Drosophila tissue culture cells treated with 20-0H ecdysone.
                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tylactone synthase ORF5 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 benign inducing factors
Claim 24; Page 103; 126pp; English.
The amino acid sequence codes for the (20-OH) ecdysone receptor
protein which is part of the insect steroid receptor superfamily.
It can be used to screen for liquids specific for the insect
steroid receptors which can be used as highly specific and highly
active pesticides which are biodegradable. See also R13791-R13794.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA encoding insect steroid receptors - and ligands, for use as

Novel human type alpha-1 (XVIII) collagen is characterised by triple helical domains containing the GXXGX'Y' motif (where X, Y, X' and Y' represent any amino acid), the helical domains being separated and flanked by non-triple helical regions which may provide flexibility. Alpha-1 collagen is expressed in multiple provide flexibility. Alpha-1 collagen is expressed in multiple comprising alpha-1 collagen nucleic acid (see T84484) and an expression control sequence can be used to express recombinant collagen in prokaryotic or eukaryotic (especially mammalian) host cells. The alpha-1 collagen may be used to treat a patient suffering from a disease associated with cartilage degradation, and for supplementing collagen. It can also be used as a connective tissue filler (e.g. for plastic surgery), can be interposed between a dermal equivalent and skin to improve adhesion, and as a substract on which to grow epithelium. The addition of glycosaminoglycans makes alpha-1 collagen a better carrier for fibroblast growth factor, and imparts greater tensile strength.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid encoding human alpha-1 collagen - for production of recombinant alpha-1 collagen, for use in the treatment of cartilage

Sequence 14, Application US/07745382
Patent No. 5270181
GENERAL INFORMATION:
APPLICANT: MCCOY, John
APPLICANT: LaVallie, Edward
TITLE OF INVENTION: Peptide and Protein Fusions To
TITLE OF INVENTION: Thioredoxin and Thioredoxin-Like Molecules
NUMBER OF SEQUENCES: 24
CORRESPONDENCE 20
ADDRESSE: Genetics Institute, Inc.
STREET: MASSACHUSETES
COUNTRY: U.S.A.
ZIP: O2140
COMPUTER READABLE FORM:
MEDIUM TYPE: IDPPPY disk
COMPUTER: IBM PC COMPATIBLE
COMPUTER: IBM PC COMPATIBLE
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
GURBENT APPLICATION DATA: 125
FILING DATE: 19910814
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                               Sequence 14, Application US/07921848
Patent No. 5292646
GENERAL INFORMATION:
APPLICANT: MCCOY, John
APPLICANT: LaVallie, Edward
TITLE OF INVENTION: Peptide and Protein Fusions To
TITLE OF INVENTION: Thioredoxin and Thioredoxin-Like Molecules
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 60; DB 1; Length 296;

Mean 31.553; Variance 48.558; scale 0.650 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- FUNCTION: THE SIGMA PACTOR IS AN INITIATION FACTOR THAT PROMOTES ATTACHMENT OF THE RNA POLYMERASE TO SPECIFIC INITIATION SITES AND THEN IS RELEASED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SIGMA-54 FAMILY.

-I- CATALYTIC ACTIVITY: ATP = 3',5'-CYCLIC AMP + PYROPHOSPHATE.

-I- IN CONTRAST TO YEAST CYCLASE, S.POWBE CYCLASE IS NOT LIKELY TO BE REGULATED BY RAS PROTEINS.
                                                                                                                                                                                                                                                                                                                                          UMETAMA T., HORIMOUCHI S.;
SUBMITTED (JAN-1995) TO EMBL/GENBANK/DDBJ DATA BANKS.
-!- FUNCTION: INVOLVED IN THE REGULATION OF SECONDARY METABOLISM BY PHOSPHORYLATING, DO BOTH SER AND THR, THE AFSR GLOBAL REGULATORY PROFEIN INVOLVED IN THE CONTROL OF SECONDARY METABOLISM.
-!- PTM: ADTOPHOSPHORYLATED AT THR AND SER RESIDUES.
-!- SIMILARITY: WITH THE CONSERVED CATALITIC DOMAINS OF SER/THR-PROTEIN KINASES.

Mean 39.425; Variance 86.061; scale 0.458

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

swiss-prot35 1:swiss1

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 41.408; Variance 75.349; scale 0.550

CELL 58:623-629(1989).

-!- SUBCELLULAR LOCATION: EXTRACELLULAR MATRIX.

-!- ALTERNATIVE PRODUCTS: FOUR FORMS OF FIBULIN-1; A (AC P23142), B

(AC P23143), C (SHOWN HERE) AND D (AC P37888); DIFFERING ONLY IN

THEIR C-TERMINAL REGIONS, ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- SIMILARITY: CONTAINS 9 EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EMBL; X53743; G31419; -..

ARGRAVES W.S., DICKERSON K., BURGESS W.H., RUOSLAHTI E.;

CELL 58:623-629(1989).

-! SUBCELLULAR LOCATION: EXTRACELLULAR MATRIX.
-! ALTERNATIVE PRODUCTS: FOUR FORMS OF FIBULIN-1; A (AC P23142), B (SHOWN HERE). C (AC P2144) AND D (AC P37889); DIFFERING ONLY IN THEIR C-TERMINAL REGIONS, ARE PRODUCED BY ALTERNATIVE SPLICING.
-! SIMILARITY: CONTAINS 3 ANAPHYLATOXIN-LIKE DOMAINS.
-! SIMILARITY: CONTAINS 9 EGF-LIKE DOMAINS.
-! SIMILARITY: CONTAINS PEGF-LIKE DOMAINS.
-! SIMILARITY: OF PRODUCED BY ALTERNATIVE SPLICING.
-! SIMILARITY: CONTAINS PEGF-LIKE DOMAINS.
-! SIMILARITY: OF PRODUCED BY ALTERNATIVE SPLICING.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The active enzyme catalyzes the transfer of acyl groups from lecithin to sterol to form sterol esters. Palmitcyl, oleoyl, and linoleoyl residues can be transferred; a number of sterols, including cholesterol, can act as acceptor. Apolipoprotein A-I is a potent activator for this enzyme.

Mean 29.422; Variance 127.873; scale 0.230 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ä
the repeat lacking two Cys residues. The same motif is found in albumin, vitamin D-binding protein and alpha-fetoprotein. The albumin, vitamin D-binding protein and alpha-fetoprotein. The disulphide stabilized loop structure is thought to be conserved. The type II motif, related to repeats found in epidermal growth actor precursor is a 6-Cys pattern repeated nine times, although the ninth repeat in the A form is incomplete. Four of the repeats, (2, 3, 4 and 9) differ from the EGF-like motif in having a 4-6 consensus sequence for Asp and Ash hydroxylation. The 7th repeat consensus sequence for Asp and Ash hydroxylation. The 7th repeat consensus sequence ED/V/Cylation sequence, CXCXPC. Immediately following each repeat is a pentapeptide with the consensus sequence XD(I/V)(D/N)E. Fibulin binds to the cytoplasmic domain of the betal subunit of integrin adhesion receptors in a cation-dependent, EDFA-reversible manner. It can be used to manipulate adhesion of cells to fibronectin, collagen, with the protein have important diagnostic and therapeutic uses. Sequence 601 AA;
                                                                                                                                                                                                                                                                                                                                        Gaps
